1 Abstract

This class provides a relative simple document-type for homework, mainly created for assignments at the University This class is inherited from `article`, it is not perfect, but I am trying my very best.

2 Options

<code>problemstyle=<1></code>	These options allow the customizatuion of the displayed numbers. For Example, if
<code>subproblemstyle=<1></code>	<code>problemstyle=Roman</code> , <code>subproblemstyle=arabic</code> , <code>subsubproblemstyle=roman</code>
<code>subsubproblemstyle=<1></code>	is passed, The first subsubproblem of the first subproblem of the first problem would be labeled as i) of Problem I.1 . Available options are <code>arabic</code> , <code>Alph</code> , <code>alph</code> , <code>Roman</code> , and <code>roman</code> . Standard values are: <code>problemstyle=arabic</code> , <code>subproblemstyle=alph</code> , <code>subsubproblemstyle=roman</code> .
<code>design=<1></code>	Allows the User to select an older page-style, for backwards compatibility. Recognized values are <code>v1</code> and <code>v2</code> . Everytime a version Changes the default look, a new possible value will be added. Only set this if you really need to get an old look, <i>older styles are not going to be maintained!</i>
<code>tikz</code>	Loads TikZ-Package and a couple of Styles, usefull for Papers in Computer-Science and ;athematics. See 7.2 for more informations
<code>fleqn</code>	Passes <code>fleqn</code> to <code>amsmath</code>

2.1 Inherited options

Because the class is inherited by `article`, every Option that can be passed to `article`, will be passed to `article`.

3 Commands

3.1 Document Informations

<code>\subject</code>	Sets the subject of the document. Takes the subject as argument. Standard Value
<code>\kurs</code>	

is “Kein Kurs”
`\kurs` is deprecated.

`\tutorial` Sets the tutorial of the author. Takes it as an argument. Standard Value is empty, so that this command can be omitted.
`\tutorium` is deprecated.

`\deadline` Sets the deadline of the document. Takes it as an argument. Standard value is `\today`.
`\abgabe` is deprecated

`\sheetTitle` Sets a descriptonal Title of the Sheet, will be written in the header of every page.

3.1.1 Inherited from article

`\author` Sets the author of the document.
`\date` Sets the date of the document.

3.2 Sectioning

Because the class is designed for Assignments, the sectioning-commands are different from Article

3.2.1 ‘plain’ Sectioning

`\problem` These commands work like theyr counterpart in article, except that there will be no number, nor will they increase a counter. Nevertheless, hey will be shown in the table of contents.
`\subproblem`
`\subsubproblem`

`\keyword{#1}` Creates a new Paragraph ,which will start with the Argument in Bold, followed by two non-breaking spaces.
The following Macros make use of `\keyword`, so it is suggested to use them instead.

`\solution` They work like `\keyword`, but take only an optional Argument print out “Solution”, “Proof” “Given”, “To show”, “Assumption”, and “Suppose that”, respectively ¹, via `\keyword`. If an argument is passed, they print out this argument after the keyword. They are not mentioned in the table of contents.
`\proof`
`\given`
`\toShow`

`\assumption`
`\supposeThat`

¹As of v1.6, Translations are added, depending on the choosen Language, there may be an other Text displayed.
See 7.4 for all Translations

3.2.2 ‘better’ Sectioning

The following commands are an augmented version of the “plain” commands.

<code>\newproblem</code>	These commands require no argument, and automatically create a numbered
<code>\newproblem*</code>	title. The optional Argument is the new value for the corresponding counter.
<code>\newsproblem</code>	Normally, <code>\newproblem</code> adds the new Created Problem to the grading-table (see
<code>\newsproblem*</code>	3.4), <code>\newproblem*</code> does not do this.

3.3 Useful Macros

3.3.1 Quod Erat Demunstarndum, End of Proof

<code>\QED</code>	Display a flushed-right <i>QED</i> , \square , or \blacksquare , respectively. <code>\qed</code> is not implemented, to
<code>\EOP</code>	keep compatibility to several Math-packages, which define the later.
<code>\eop</code>	

3.3.2 Quod Non Erat Demunstarndum at iucundum est

<code>\QNE</code>	Display a flushed-right \triangle . <code>\QNE</code> displays it in a new line, <code>\qned</code> at the end of
<code>\qned</code>	the same line.
	In Mathematical proofs this symbol is used to mark things, which we did not
	intend to proof, but are interesting anyway.

3.3.3 Stolen Goods

»Das ist alles nur geklaut«

~Tobias Künzel

These Commands are not mine, they are all stolen from Alexander Bartolomey’s²
amath-Class³

<code>\N</code>	Defines a set of mathematical sets, which are very usefull (see Table 1)		
<code>\Z</code>			
<code>\R</code>	Command	Output	Description
<code>\Q</code>	<code>\N</code>	\mathbb{N}	Natural Numbers
<code>\C</code>	<code>\Z</code>	\mathbb{Z}	Whole Numbers
<code>\F</code>	<code>\Q</code>	\mathbb{Q}	Rational Numbers
<code>\Primes</code>	<code>\R</code>	\mathbb{R}	Real Numbers
	<code>\C</code>	\mathbb{C}	Complex Numbers
	<code>\F_n</code>	\mathbb{F}_n	Prime Field to base n
	<code>\Primes</code> ⁴	\mathbb{P}	Set of all Primes

Table 1: Field-Commands

Functions and Operators Output usefull Plaintext-Operators and Functions. See table 2. Require Math-

²“Occloxiium” on GitHub:<https://github.com/occloxiium>

³amath.sty is part of Alexander Bartolomey’s Alphabet Classes: <https://github.com/occloxiium/AlphabetClasses>

⁴Has to be `\Primes`, because `\P` is already in use

mode

Command	Output
<code>\divides and property</code>	Prints a vertical Bar
<code>\Var</code>	Var
<code>\Perm</code>	Perm
<code>\Comb</code>	Comb
<code>\MComb</code>	MComb
<code>\Pot</code>	Pot
<code>\Map</code>	Map
<code>\Bin</code>	Bin
<code>\GL</code>	GL
<code>\id</code>	id
<code>\dx</code>	dx
<code>\excup</code>	$\dot{\cup}$
<code>\diff{<1>}</code>	$\frac{d}{d<1>}$

Table 2: Text-like Functions

`\falls` prints out $\ggfalls\ll$ ⁵

3.3.4 Rounding

Require Mathmode

Command	Output	Meaning
<code>\floor{<1>}</code>	$\lfloor <1> \rfloor$	floor $<1>$
<code>\ceil{<1>}</code>	$\lceil <1> \rceil$	ceil $<1>$
<code>\roundHU{<1>}</code>	$\lceil <1> \rceil$	Round $<1>$ “half up” ($\lfloor <1> + \frac{1}{2} \rfloor$)
<code>\roundHD{<1>}</code>	$\lfloor <1> \rfloor$	Round $<1>$ “half down” ($-\lfloor <1> - \frac{1}{2} \rfloor$)

Table 3: Rounding Functions

3.4 Grading Table

This Document-Class is still mainly designed for Homework, so it would be nice, if there was a table to write Grades into, wouldn’t it?

<code>\addToGradingTable</code>	Adds the given parameter as an exercise to the Grading-Table. All Problems, created with <code>\newproblem</code> are added automatically.
<code>\makeGradingTable</code>	Prints out the Table containig all Defined exercises (\neq Problems). Like <code>\tableofcontent</code> , it needs a second run of L ^A T _E X, until all are added. See example documents fot output

⁵In German, actual Translation may differ

5.1 Version–Scheme

Since Version 2.0 the following version–scheme applies:

Major Version has to be increased, if

- there are changes, which create visible changes in the output of existing documents (except for bugfixes), or
- a command is removed or changed in a way, that existing documents do not compile with the new version.

Minor Version has to be increased, if

- new backwards compatible commands are introduced
 - Bugfixes may be introduced too.

The minor version of stable releases is always even, the minor version of development versions is always odd. (0 counts as even).

Patches May be introduced on Stable Branch. With every non-document-breaking bugfix, the patch–number has to be incremented.

Because Fixing Bugs is a part of development, development–versions do not have numeric patch–numbers, but alphabetic identifiers, directly after the minor–version.

8.1.2 Counter-Style Parser

Counter--Style Parser This takes a style-input (#1), one of the three previous defined commands (#2) and the corresponding counter (#3) to redefine #1, so that it corresponds to #2. See 8.1.3 for example usement.

```
