Abstract

This Class provides a clean, multicolumn look designed for Cheat Sheets

Options

(Not)Inherited options

Because the class is inherited by article, every Option that can be passed to article, will be passed to article. There is only one restriction:

twocolumn Because I create the columns with `multicol`, `article` would screw up the layout if `twocolumn` would be passed, so this raises an error.

Own options

Currently, there are no own options.

Commands

Useful Macros

Development and support

The class is developed at *GitHub*:

<https://github.com/ACHinrichs/LaTeX-templates>

Please refer to that site for any bug report or development information.

Changelog

v0.2 - 2017/07/06 Initial

v0.4 - 2017/07/29 Enclose document with `multicol` (technicaly, it is the other way around)

Note: The minor version of stable versions is always even, the minor version of unstable versions is always odd. There are no unstable patch-versions, instead unstable versions get an alphabetical suffix.

Known Bugs

- When trying to use `\lstinline` in the label of an `description`-item, the code-snippet will be displayed at the bottom of the column. Possibly relates to floats not being supported by `multicol`

Examples

For examples, pleas see the Git-Repo at

<https://github.com/ACHinrichs/LaTeX-templates> or my CheatSheets at

<https://github.com/ACHinrichs/CheatSheets> or **this document!**

⁰This document corresponds to CheatSheet.cls v0.4, dated 2017/07/29
